

Retro Plate Maintenance Instructions

The Retro Plate system will create a hardened, water repellant, and dust proof surface to your exposed concrete. It is not immediately impervious, however, and does require proper maintenance. This densified surface is very maintenance friendly. No more harsh detergents, sweeping compounds and no more dusting concrete. All that is needed to maintain the shine and seal on most floors is an automatic scrubbing machine and mild detergent.

What to avoid:

No acidic cleaners. Acidic detergents will etch the surface over time and dull the finish. No aggressive scrubbing brushes. Stratagrit, nylogrit and other aggressive scrubbing brushes will alter the polish pattern and leave a dull appearance. Avoid all contact with acid. Avoid any detergents containing Hydroxides, or Sulfates.

What to use:

Retro Clean is the recommended cleaning detergent. Retro Clean is a detergent and a conditioner for your floor. Use soft brushes on the scrubbing machine. Black nylon brushes are sufficient, or a red or white pad. Scrub the floor to remove dirt and debris that can collect on the surface, covering the shine and creating a slippery environment. Spills should be cleaned up as quickly as possible. For serious spills and very greasy environments, a non-acidic degreaser that meets the above requirements will work well.
